

Voice over Internet Protocol

Voice over internet protocol (VoIP) is a phone system that uses an internet connection to make and receive calls, instead of a traditional land line.

VoIP is an alternative to local telephone companies. You are able to call anyone without the need for local phone service, as long as you have internet connection.

AsystYOU Technology will install, configure, and maintain your VoIP system. VoIP gives you the flexibility to use your desk phone, computer, or mobile phone to answer your phone calls. You can "work from your desk" from anywhere in the world.

Benefits of VoIP

- 01 Save Money
- 02 Premium Features
- 03 Phone Service Anywhere
